

## Palaeogeographic Maps of the Arabian Plate Foreland Basin

The Cambridge Carbonates database of palaeogeography maps for the Arabian Plate Foreland Basin have been extensively updated in 2025, with these revised maps available to purchase in pdf format. The palaeogeography maps are based on published data and more than 35 years experience in the Middle East and are produced within the Sharland et al. (2001, 2004) stratigraphic framework. For each 3rd order sequence, a map is available for the MFS, highstand, transgressive and lowstand system tract. In total >420 maps are available from the Precambrian through to the Quaternary.

The recent update has focussed on improved definition of Mesozoic stratigraphy in marine areas, and expansion of the mapped area towards the S/SW into the outcrop belts, allowing much better definition and calibration of Lower Jurassic to InfraCambrian palaeogeographies.

Our maps are invaluable when evaluating acreage in bid rounds and allow detailed assessment of reservoir – seal – source combinations. The maps also provide our clients with a more regional understanding of play fairways beyond their own acreage, which is often critical in exploration and development

The maps can be purchased as a full set, or as a “bespoke” set which can be tailored to a client’s needs. For a full listing of available maps, a FREE SAMPLE MAP, and costings, please contact ANDY for further information. Please note that special rates for updated maps are available to clients who purchased previous versions.
